# Introduction

RxView is capable of handling DDE commands from other applications. This document describes the DDE capabilities of RxView.

## DDE and Plugins

If RxView does not recognize a DDE command, it will send the command further to any plugins that may be included in the RxView application. If a plugin then recognizes the DDE command it will perform the instruction; if no plugin recognizes the command then the command will be ignored.

## DDE Server

RxHighlight registers itself as a DDE server with the service name **RxView**. The DDE client can send commands to RxView using the **DDE Execute** command, and can request information from RxView using the **DDE Request** command. When the client application sends an **execute** or **request** command, it must provide two strings (**topic** and **item**) with the command. The topic string must be one of the following eight topics:

**File**  
**Print**  
**Zoom**  
**Pan**  
**Set**  
**Get**  
**Draw**  
**System**

## Item

The **item** string has the following syntax: "**command[value]**".

The command part of the string is a set of predefined commands.

The command may optionally be followed by a value string enclosed in square brackets.

Depending on the command, the value itself may be a name string such as a filename or a set of values separated by commas.

# RxView Commands

## DDE Activate

Activate an Opened file.

Topic:      **File**  
Item:        Activate[filename]

## DDE Cascade

Cascade all image windows.

Topic:      **System**  
Item:        Cascade[]

## DDE Close

Close active file.

Topic:      **File**  
Item:        **Close[]**

## **DDE Exit**

Force RxHighlight to exit.

Topic:      **System**  
Item:        **Exit[]**

## **DDE Get Active File**

Get the name of active file.

Topic:      **File**  
Item:        **Active[]**

Result string: Path and name of currently active file.

## **DDE Get Display Position**

Get current display position of active file.

Topic:      **Get**  
Item:        **DspPos[]**  
Result string I,t  
Where:       I = the leftmost displayed position of the active file.  
                t = the topmost displayed position of the active file.

## **DDE Get Displayed Page Number**

Get current displayed page number of active file.

Topic:      **Get**  
Item:        **DspPage[]**  
Result string p  
Where:       p = the current displayed page no. (0-based).

## **DDE Get First File**

Get the name of first loaded file.

Topic:      **File**  
Item:        **First[]**  
Result string Path and name of first loaded file.

## **DDE Get Next File**

Get the name of next loaded file.

Topic:      **File**  
Item:        **Next[]**  
Result string Path and name of next loaded file if any.

## **DDE Get Rotation**

Get current rotation of active file.

Topic:      **Get**  
Item:        **DspRot[]**  
Result string a  
Where:       a = the current rotation angle (0, 90, 180 or 270).

## **DDE Get Scaling**

Get current scaling of active file.

Topic:      **Get**  
Item:        **DspScale[]**

Result string s  
Where: s = the current scaling (1 = unscaled, 1.5 = 50% up).

## DDE Get Signature

Get User Signature.

Topic: **Get**  
Item: **Sign[]**  
Result string Signature of current user.

## DDE Get Size

Get size (in dots) of active file.

Topic: **File**  
Item: **Size[]**  
Result string w,h  
Where: w = width extent of active file.  
h = height extent of active file.

## DDE Get Type

Get the type of active file.

Topic: **File**  
Item: **Type[]**  
Result string t  
Where: t = one of the following values:  
1 = color picture.  
2 = monochrome raster.  
4 = vector drawing.  
8 = document.  
16 = spreadsheet.  
32 = hybrid.

## DDE Get no of Pages

Get no. of pages in active file.

Topic: **Get**  
Item: **Pages[]**  
Result string No of pages in active file.

## DDE Maximize

Maximize RxHighlight.

Topic: **System**  
Item: **Maximize[]**

## DDE Minimize

Minimize RxHighlight.

Topic: **System**  
Item: **Hide[]**

## DDE Open

Open a file for viewing/redlining.

Topic: **File**

Item: **Open[filename]**

## DDE Pan to Bottom Left

Pan active file to bottom left corner.

Topic: **Pan**

Item: **BottomLeft[]**

## DDE Pan to Bottom Right

Pan active file to bottom right corner.

Topic: **Pan**

Item: **BottomRight[]**

## DDE Pan to Center

Pan active file to center.

Topic: **Pan**

Item: **Centre[]**

## DDE Pan to Page

Pan active file to a page no.

Topic: **Pan**

Item: **Page[pageno]**

Where: pageno is the (0-based) page number to pan to.

## DDE Pan to Position

Pan active file to a top/left display position.

Topic: **Pan**

Item: **DspPos[l,t]**

Where: l = leftmost display position.

t = topmost display position.

## DDE Pan to Top Left

Pan active file to top left corner.

Topic: **Pan**

Item: **TopLeft[]**

## DDE Pan to Top Right

Pan active file to top right corner.

Topic: **Pan**

Item: **TopRight[]**

## DDE Print Current

Print current displayed portion.

Topic: **Print**

Item: **Current[filename]**

If no filename is specified within the topic brackets, the active file is printed.

## **DDE Print All**

Print file (all pages scaled to fit paper).

Topic: **Print**

Item: **[filename]**

If no filename is specified within the topic brackets, the active file is printed.

## **DDE Print Page**

Print file (current page scaled to fit paper).

Topic: **Print**

Item: **Page[pageno]**

Where: pageno = the (0-based) page number to be printed.

If no filename is specified within the topic brackets, the active file is printed.

## **DDE Rename**

Rename caption of active file.

Topic: **File**

Item: **Name[name]**

## **DDE Restore**

Restore (from minimize) RxHighlight.

Topic: **System**

Item: **Show[]**

## **DDE Rotate File**

Rotate current page of active file.

Topic: **Set**

Item: **DspRot[v]**

Where: v = rotation angle.

Only the values 0, 90, 180 and 270 are accepted.

## **DDE Set Signature**

Set user signature.

Topic: **Set**

Item: **Sign[name]**

## **DDE Tile**

Tile all image windows.

Topic: **System**

Item: **Tile[]**

## **DDE Zoom**

Zoom active file to scale 1 to 1.

Topic: **Zoom**

Item: **Scaled[x]**

Where: x = scaling factor.

1 = unscaled.

1.5 = zoomed in 50 %.

0.5 = zoomed out 50%.

## **DDE Zoom 1 to 1**

Zoom active file to scale 1 to 1.

Topic:      **Zoom**  
Item:        **Unscaled[]**

## **DDE Zoom All**

Zoom active file to fit paper.

Topic:      **Zoom**  
Item:        **[]**

## **DDE Zoom Up**

Zoom active file 50% up.

Topic:      **Zoom**  
Item:        **Up[]**

## **DDE Zoom Down**

Zoom active file 50% down.

Topic:      **Zoom**  
Item:        **Down[]**

## **DDE Zoom Width**

Zoom active file to fit paper width.

Topic:      **Zoom**  
Item:        **Width[]**

# RxHighlight Commands

## DDE Colors

A draw command color index is a reference to the RxHighlight color table as follows:

Index	Color:
0	Red
1	Green
2	Blue
3	Yellow
4	Magenta
5	Cyan
6	Dark Red
7	Dark Green
8	Dark Blue
9	Dark Yellow
10	Dark Magenta
11	Dark Cyan
12	Black
13	White

**Note** RxHighlight can now use any color as the comment and layer color.

Old DDE calls using color indexes will still work, but new functions using true color have been added.

## DDE Flush

Use this command to force a screen update.

### Flush DDE Draw

Topic: **Draw**  
Item: **Flush[]**

## DDE Font

Set the desired text font to be used in DDE StringDDE\_String commands.

Topic: **Draw**  
Item: **Font[height,width,.....,facename]**

I.e. all members of a Windows LOGFONT structure.

Height  
Width  
Escapement  
Orientation  
Weight  
Italic  
Underline  
StrikeOut

CharSet  
OutPrecision  
ClipPrecision  
Quality  
PitchAndFamily  
FaceName

## DDE Line

Draw a line.

Topic: **Draw**  
Item: **Line[linewidth,color,startx,starty,endx,endy]**  
Where: linewidth = the line width of an outlined oval.  
color = one of the [DDE draw colors](#).  
startx,starty = the line start coordinates.  
endx,endy = the line end coordinates.

**Note** Drawing on the screen on top of the viewed file has nothing to do with commenting, and the drawn objects will be lost when the user closes the file.

**Note** RxHighlight can now use any color as the draw color.

To draw with a color other than the standard indexed colors, use the new function below:

Topic: **Draw**  
Item: **NewLine[linewidth,r,g,b,startx,starty,endx,endy]**  
Where: linewidth = the line width of an outlined oval.  
r = red component of the draw color (0-255).  
g = green component of the draw color (0-255).  
b = blue component of the draw color (0-255).  
startx,starty = the line start coordinates.  
endx,endy = the line end coordinates.

## DDE Marker

Set marker draw mode on or off.

Topic: **Draw**  
Item: **Marker[state]**  
Where: state = 0 set marker mode off.  
state = 1 set marker mode on.

**Note** Marker mode is default off. DDE marker mode gives the same effect as described for comment marker modeDRAW\_ICON\_Marker\_on\_off.

## DDE Oval

Draw an oval.

Topic: **Draw**  
Item: **Oval[linewidth,color,filled,left,top,right,bottom]**  
Where: linewidth = the line width of an outlined oval.  
color = one of the DDE draw colorsDDE\_Colors.  
filled = 0 means outlined oval.  
filled = 1 means filled oval.  
left,top,right,bottom = the enclosing oval coordinates.

**Note** Drawing on the screen on top of the viewed file has nothing to do with commenting, and the drawn objects will be lost when the user closes the file.

**Note** RxHighlight can now use any draw color.

To draw with a color other than the standard indexed colors, use the new function below:

### Draw an oval

Topic: **Draw**  
Item: **NewOval[linewidth,r,g,b,filled,left,top,right,bottom]**  
Where: linewidth = the line width of an outlined oval.  
r = red component of the draw color (0-255).  
g = green component of the draw color (0-255).  
b = blue component of the draw color (0-255).  
filled = 0 means outlined oval.  
filled = 1 means filled oval.  
left,top,right,bottom = the enclosing oval coordinates.

## DDE Rectangle

Draw a rectangle.

Topic: **Draw**  
Item: **Rect[linewidth,color,filled,left,top,right,bottom]**  
Where: linewidth = the line width of an outlined rectangle.  
color = one of the DDE draw colorsDDE\_Colors.  
filled = 0 means outlined rectangle.  
filled = 1 means filled rectangle.  
left,top,right,bottom = the enclosing rectangle coordinates.

**Note** Drawing on the screen on top of the viewed file has nothing to do with commenting, and the drawn objects will be lost when the user closes the file.

**Note** RxHighlight can now use any draw color.

To draw with a color other than the standard indexed colors, use the new function below:  
Draw a rectangle.

Topic: **Draw**  
Item: **NewRect[linewidth,r,g,b,filled,left,top,right,bottom]**  
Where: linewidth = the line width of an outlined rectangle.  
r = red component of the draw color (0-255).  
g = green component of the draw color (0-255).  
b = blue component of the draw color (0-255).  
filled = 0 means outlined rectangle.  
filled = 1 means filled rectangle.  
left,top,right,bottom = the enclosing rectangle coordinates.

## DDE Relative Draw

Set relative drawing mode on or off.

Topic: **Draw**  
Item: **Relative[state,width,height]**  
Where: state = 0 sets marker mode off.  
state = 1 sets marker mode on.  
width = the relative width of active file.  
height = the relative height of active file.

**Note** Relative drawing mode is default off.

**Example** If you set Relative Drawing Mode to On and set the width and height to 100, a draw line commandDDE\_Line with start coordinates 0,0 and end coordinates 100,100 will draw a diagonal line across the entire displayed file page irrespective of the real size of the page.

## DDE Save

Save Comments for all files.

Topic: **File**  
Item: **Save[]**

## DDE String

Draw string.

Topic: **Draw**  
Item: **String[color,rotation,left,top,string]**  
Where: color = One of the DDE draw colors.  
rotation = 0-359 clockwise.  
left,top = the upper left start coordinates of the text draw position.  
string = the string to draw.

The string is drawn using the current font.

**Note** Drawing on the screen on top of the viewed file has nothing to do with commenting, and any drawn objects will be lost when the user closes the file.

**Note RxHighlight can now use any color as the draw color.**

To draw with a color other than the standard indexed colors, use the new function below:

## Draw string

Topic: **Draw**  
Item: **NewString[r,g,b,rotation,left,top,string]**  
Where: r = red component of the draw color (0-255).  
g = green component of the draw color (0-255).

b = blue component of the draw color (0-255).

rotation = 0-359 clockwise.

left,top = the upper left start coordinates of the text draw position.

string = the string to draw.

The string is drawn using the current font.
