MicroStation TeamMate

MicroStation TeamMate™ is a robust document and workflow management tool which is tightly integrated into the MicroStation environment. TeamMate is focused on the needs of MicroStation users, with emphasis on the management of design files, their associated reference files, and cell libraries. TeamMate can also be used to manage the various supporting documents for engineering projects, such as word processing, database, and spreadsheet files. MicroStation TeamMate can manage how MicroStation designs and documents are created, edited and reviewed through an easy 'check-in-check-out' front end. TeamMate provides secure, customizable user access rights that can be modified as needed during different stages of the project workflow. Like other members of the MicroStation product line, TeamMate is both a product and a powerful development platform. It is pre-configured for immediate use in a production environment, but can also be customized using the MicroStation Development Language (MDL) to provide document management solutions to meet the specific needs of corporate users.

- Full MicroStation integration
- Fully customizable through MDL
- Hierarchical document classification
- Flexible document classification
- Flexible document selection
- 'Query by example' selection
- Check-in-check-out front end
- Document sets
- Workflow management
- Revision control
- Reference file control
- Check-out to external organizations
- Archiving
- Audit trails
- History files
- Launching of applications

MicroStation integration

MicroStation TeamMate is a document and workflow management environment that is completely integrated into the MicroStation environment. It offers full compatibility with the MicroStation .dgn file format, and it is fully customizable through MDL. The well-tested underlying engine of MicroStation TeamMate guarantees a professional level of functionality. MicroStation TeamMate consists basically of two parts: an administrator module and a user module. The administrator can create, modify and delete individual users and user groups, used applications, departments, workflows, naming conventions, etc. Using the settings made by the administrator, the user can classify his documents in a hierarchical way using logical partitionings according to a project, discipline or departmental structure within the organization. Tight control over a project and its documents can be gained using access control, workflow management, history files, accounting, and many other functions.

Fully customizable

MicroStation TeamMate can be used immediately in a production environment, but many professional organizations require that document management solutions meet their specific corporate needs. MicroStation TeamMate is very well suited for this purpose because it is fully customizable through MDL, like many other products in the MicroStation product line. This ensures that company standards for document and workflow management can be seamlessly integrated with MicroStation TeamMate.

Open approach

MicroStation TeamMate employs a client-server product architecture, and takes an open approach towards platforms, operating systems, databases and networks. It supports a variety of industry standard ODBC-compliant server databases, including Microsoft Access™, Microsoft SQL Server™, Oracle®, and Informix®. The client module is an MDL application which can be delivered on any MicroStation platform, including DOS, Windows 3.x/95/NT, Windows NT (DEC Alpha), OS/2, Macintosh, PowerMac, HP-UX, SGI Irix, IBM RS/6000 AIX, Sun Solaris and Intergraph CLIX. MicroStation TeamMate can make use of any TCP/IP-compliant network.

MicroStation TeamMate runs on top of MicroStation 95, MicroStation PowerDraft, MicroStation V5, or MicroStation Review. Versions that work outside of MicroStation are planned.
